Atlas of Hematopathology: Morphology, Immunophenotype, Cytogenetics, and Molecular Approaches, Second Edition, will appeal to both a wide range of people undergoing training in a variety of medical fields and practicing non-hematopathologists. For clinicians, fellows and residents, correct diagnosis (and therefore correct treatment) of diseases depends on a strong understanding of the molecular basis for the disease, making this book a crucial resource. This atlas contains hundreds of high-quality color images that mirror the findings that fellows and clinicians encounter in practice. In addition, it provides information in a quick, simple

and user-friendly manner, attracting both those in training and non-experts. Residents, fellows, practicing clinicians, and researchers in pathology, hematology and hematopathology/oncology will find this a useful resource. Covers both non-neoplastic hematopathology and neoplastic hematopathology in all organs and tissues Demonstrates results of important complementary diagnostic tests, such as immunophenotyping (immunohistochemical stains and flow cytometry), karyotyping, FISH and DNA/molecular studies Provides tables to summarize the most important clinicopathological features Saves clinicians and researchers time in quickly accessing the very latest details on the diverse clinical and scientific aspects of hematopathology

This comprehensive, full color hematopathology reference book emphasizes immunophenotypic features, cytogenetic studies, and diagnostic molecular aspects. Hematopathology begins with introductions to morphologic evaluation of the hematopoietic tissues and principles of immunophenotyping, cytogenetics and molecular studies followed by chapters dedicated to different types of hematologic disorders. Each chapter starts with a basic overview of hematopathology followed by a comprehensive review of immunophenotypic, cytogenetic and molecular findings. The text is balanced with large numbers of full color images, graphs, charts, and tables to assist the reader in understanding these highly technical issues. * Emphasizes the immunophenotypic features, cytogenetic studies, and diagnostic molecular aspects of hematology * Features hundreds of images, charts and tables for the identification of hematologic disorders not only based on histopathologic features, but also with the use of advanced accessory techniques.

This Atlas is an essential guide to both the diagnosis and

differential diagnosis of neoplastic hematopathologies, based on specific parameters. It will be an invaluable reference for all practicing hematologists, oncologists and pathologists.

Atlas of Differential Diagnosis in Neoplastic

Hematopathology, Second Edition discusses: basic clinical data prognostic data morphologic data phenotypic data Including over 600 color illustrations, Atlas of Differential Diagnosis in Neoplastic Hematopathology, Second Edition is extensively referenced and updated. Covering neoplastic hematopathology, with an emphasis on the differential diagnosis, numerous tables summarize the phenotypic profiles of the most common hematologic tumors, for the practicing hematologist, oncologist and pathologist. NEW TO THE SECOND EDITION: A multimethodologic approach to neoplastic hematopathology New and significantly updated sections on differential diagnosis and morphology, chromosomal and genetic changes, and localization

This essential guide can help readers identify blood type cells, which are difficult to categorize, and explains the morphologic characteristics of peripheral blood cells in detail. Some of the book's features include: color photographs that depict each stage of cell maturation in the exact sequence of development; comparative photographs of difficult-to-identify cells from different cell lines with adjacent diagrams and instructions in chart form; and an explanation of the entire differential procedure, with mathematical guidelines.

Due to its rapid development in recent years, hematopathology has become a very complicated discipline. The current development is mainly in two aspects: the new classification of lymphomas and leukemias and the new techniques. The Revised European-American Classification of Lymphoid Neoplasms (REAL classification) and the World

Health Organization (WHO) classification of hematologic neoplasms require not only morphologic criteria but also immunophenotyping and molecular genetics for the diagnosis of hematologic tumors. Immunophenotyping is performed by either flow cytometry or immunohistochemistry. There are many new monoclonal antibodies and new equipments accumulated in recent years that make immunophenotyping more or more accurate and helpful. There are even more new techniques invented in recent years in the field of molecular genetics. In cytogenetics, the conventional karyotype is supplemented and partly replaced by the fluorescence in situ hybridization (FISH) technique. The current development of gene expression profiling is even more powerful in terms of subtyping the hematologic tumors, which may help guiding the treatment and predict the prognosis. In molecular biology, the tedious Southern blotting technique is largely replaced by polymerase chain reaction (PCR). The recent development in reverse-transcriptase PCR and quantitative PCR makes these techniques even more versatile. Because of these new developments, hematopathology has become too complicated to handle by a general pathologist. Many hospitals have to hire a newly trained hematopathologist to oversee peripheral blood, bone marrow and lymph node examinations. These young hematopathologists are geared to the new techniques, but most of them are inexperienced in morphology. No matter how well-trained a hematopathologist is, he or she still needs to see enough cases so that they can recognize the morphology and use the new techniques to substantiate the diagnosis. In other words, morphology is still the basis for the diagnosis of lymphomas and leukemias. Therefore, a good color atlas is the most helpful tool for these young hematopathologists and for the surgical pathologists who may encounter a few cases of hematologic tumors from time to time. In a busy daily practice, it is difficult to refer to a

comprehensive hematologic textbook all the time. There are a few hematologic color atlases on the market to show the morphology of the normal blood cells and hematologic tumor cells. These books are helpful but not enough, because tumor cell morphology is variable from case to case and different kinds of tumor cells may look alike and need to be differentiated by other parameters. The best way to learn morphology is through the format of clinical case study. This format is also consistent with the daily practice of hematopathologists and with the pattern in all the specialty board examinations. Therefore, it is a good learning tool for the pathology residents, hematology fellows as well as medical students. This proposed book will present 83 clinical cases with clinical history, morphology of the original specimen and a list of differential diagnoses. This is followed by further testing with pictures to show the test results. At the end, a correct diagnosis is rendered with subsequent brief discussion on how the diagnosis is achieved. A few useful references will be cited and a table will be provided for differential diagnosis in some cases. The major emphasis is the provision of 500 color photos of peripheral blood smears, bone marrow aspirates, core biopsy, lymph node biopsy and biopsies of other solid organs that are involved with lymphomas and leukemias. Pictures of other diagnostic parameters, such as flow cytometric histograms, immunohistochemical stains, cytogenetic karyotypes, fluorescence in situ hybridization and polymerase chain reaction, will also be included. A comprehensive approach with consideration of clinical, morphologic, immunophenotypic and molecular genetic aspects is the best way to achieve a correct diagnosis. After reading this book, the reader will learn to make a diagnosis not only based on the morphology alone but also in conjunction with other parameters.

Ideal as a quick, easy-to-use reference in the laboratory or clinical setting, Atlas of Diagnostic Hematology is an abundantly illustrated guide to the vast range of malignant and non-malignant disorders of the blood. More than 1,200 vibrant, full-color images enable you to identify and compare the unique clinical and histologic features of various blood disorders and confidently reach a diagnosis. Coverage includes photos of actual cases that span the entire range of this complex field, including rare conditions and difficult diagnoses. Features more than 1,200 images including full-color pathologic and clinical images covering a wide range of hematologic malignant and non-malignant conditions. Covers a range of disease stages, from the slightest indication where diagnosis can be complicated or missed entirely, to what the average blood or biopsy sample signifying disease may look like, to an advanced stage where disease indications are abundantly clear. Helps you distinguish between similar and overlapping features and symptoms to arrive at an accurate diagnosis. Provides up-to-date information on infectious processes in blood and bone marrow, classification system of myeloid neoplasms, and indolent and aggressive mature T and NK-cell lymphomas. Includes diagnostic algorithms with differential diagnoses for conditions with similar histologic features and clinical symptoms. Contains the latest WHO classifications for pathologic, genetic, and clinical information.

The Third Edition of Knowles Neoplastic Hematopathology has been thoroughly updated by the world's experts to cover all aspects of neoplastic hematopathology, a field that covers disorders of the bone marrow, spleen, and lymphatic system. Now in full-color, this completely revised and expanded edition integrates the basic science, modern diagnostic techniques, and clinical aspects of malignant diseases affecting these organs. It is the most comprehensive,

A Flexibook for both the specialist and non-specialist, the new book offers accessible information on hematology in a succinct format. In addition to providing basic methodology, the book utilizes more than 260 color illustrations to detail the most up-to-date clinical procedures. Numerous tables and flow charts are included to assist in differential diagnosis, making this a valuable didactic reference for nurses, practicing physicians and residents preparing for board examinations.

Morphology of Blood Disorders, 2nd edition is an outstanding atlas with over 800 high-quality digital images, covering the whole spectrum of blood and bone marrow morphology, with particular emphasis on malignant haematology. Originally written in the Italian language by two world leaders in the field, the book has been expertly translated by the renowned haematologist and teacher, Barbara Bain. This book explores the major topics of haematological pathology, blending classical teaching with up-to-date WHO classification and terminology. Each image in this book is derived from material obtained for diagnostic purposes from patients with serious haematological conditions. Morphological details are supplemented by detailed descriptions of the output and role of automated instruments in disorders of the blood. Morphology of Blood Disorders, 2nd edition is an essential reference source for diagnosis in the haematology laboratory, designed to be the go-to guide for anyone with an interest in blood cell morphology.
