Electromagnetic fields at high frequencies Mobile telephones, television and radio transmitters and radar produce RF fields. These fields are used to transmit information over long distances and form the basis of telecommunications as well as radio and television broadcasting all over the world.

WHO | What are electromagnetic fields?

One of Koch's collaborators, György Buzsaki was fairly clear as far back as 2004 in terms of where he stood on this debate, highlighting various functions that the brain's electromagnetic fields perform, including linking different areas of the brain together, facilitating synaptic changes, and creating and consolidating memory. So Buzsaki accepts that these fields have functional roles ...

An electromagnetic field is a classical field produced by moving electric charges. It is the field described by classical electrodynamics and is the classical counterpart to the quantized electromagnetic field tensor in quantum electrodynamics. The electromagnetic field propagates at the speed of light and interacts with charges and currents. Its quantum counterpart is one of the four fundamental forces of nature The field can be viewed as the combination of an electric field and a magnetic fiel

The brain's fields are generated by various physiological processes in the brain, but primarily by trans-membrane currents moving through neurons. These fields are always oscillating and they come in various speeds, clustered around certain bands, from delta on the lower end at 1-2.5 cycles (oscillations) per second (Hertz) up to gamma at 40-120 cycles per second.
