Molecular Plant Breeding: Frequently Asked Questions ...

Molecular breeding is the application of molecular biology tools, often in plant breeding and animal breeding. In Broad sense, Molecular breeding can be defined as the use of genetic manipulation performed at DNA levels to improve traits of interest in plants and animals, and it may also include genetic engineering or gene manipulation, molecular marker-assisted selection, and genomic selection.

Molecular Plant Breeding Expands Useful Genetic Diversity for Crop Improvement. The maximum potential for genetic gain is proportional to the phenotypic variation (P) present in the original source population and maintained in subsequent cycles of selection. Phenotypic variation is positively associated with genetic diversity, yet also depends on environmental factors and the interactions between genotype and environment.

Molecular Plant Breeding as the Foundation for 21st ...

Molecular breeding using DNA markers often provide a wide array of applications in the field of plant improvement. Molecular markers are used for the analysis of genetic variation in germplasm available for plant improvement. Molecular marker aided breeding strategy involves the potentiality of molecular markers in plant breeding, particularly helps in marker assisted selection procedure which speeds up the whole breeding process.

Application of Biotechnology in Plant Breeding

Plant Breeding involves a variety of aspects, ranging from the molecular level to the population level and requires knowledge on the physiology, ecology and genetics of cultivated plants. The use of various molecular techniques contributes enormously to the rapid identification of genes for natural resistance and is essential for accelerating the selection process by marker-assisted breeding.

Plant breeding can be accomplished through many different techniques ranging from simply selecting plants with desirable characteristics for propagation, to methods that make use of knowledge of genetics and chromosomes, to more complex molecular techniques (see cultigen and cultivar). Genes in a plant are what determine what type of qualitative or quantitative traits it will have.
