At a sufficient doping level, the porous silicon can be highly conductive and thus responsive to analytes in the electrical domain in parallel with optical signals, providing a basis for multiparametric sensing.

Porous Silicon Structures as Optical Gas Sensors

Porous silicon—a substance which is produced by a treatment of Si wafers in hydrofluoric acid solutions was known since the fifties due to the works by Uhrliir Turner , Memming and Schwandt . The material was considered as suitable for electronic applications (local insulation, gettering of impurities, sacrificial layers, etc.) but never in relation with optical applications.
