Construction methods used to build concrete bridge decks and substructures are detailed and direct guidance on the choice and the sizing of different types of concrete bridge deck is given. In addition guidance is provided on solving recurring difficult problems of detailed design and realistic examples of the design process are provided.

## The Design of Prestressed Concrete Bridges: Concepts and ...

Prestressed concrete decks are commonly used for bridges with spans between 25m and 450m and provide economic, durable and aesthetic solutions in most situations where bridges are needed. Concrete remains the most common material for bridge construction around the world, and prestressed concrete is frequently the material of choice.

The preliminary design uses six rows of 45 in. prestressed concrete girders, spaced at 8'- 9" (see Transverse Section). This configuration will be analyzed, and a prestressing strand pattern designed using the CONSPAN computer program. For program input, dead loads must be calculated and design data assembled.

bridges. The type of reinforced or prestressed concrete bridge deck depends mainly on the functional requirements, the structural form, and the main span length of the construction. Precast or cast in situ reinforced concrete (r.c.) bridge decks can be practically applied for all structural types, like arch, cable-stayed, extradosed, and even suspension bridges with a majority of girder ...
